

## **ABSTRACT OF THE INVENTION**

An implement, such as a header for a combine, having an integral transport system with a pair of ground engaging wheels that are moved between transport positions used in transporting the implement and stowed positions on the implement during use of the implement. The wheels may be used as gauge wheels during use to support the ends of the implement. A trailer tongue is retractable and stowed onboard the implement during use, as is a tongue jack. Lights are provided at the end of the implement for visibility during transport. The lights are stowed beneath a cover on the end of the implement to protect the lights from damage during use. All components of the transport system are carried on the implement during use to ensure that they are with the implement when needed to transport the implement. All components are mounted with pins, enabling the implement to be converted between transport and use configurations without the use of hand tools.

### **ASSIGNMENT**

The entire right, title and interest in and to this application and all subject matter disclosed and/or claimed therein, including any and all divisions, continuations, reissues, etc., thereof are, effective as of the date of execution of this application, assigned, transferred, sold and set over by the applicant(s) named  
5 herein to Deere & Company, a Delaware corporation having offices at Moline, Illinois 61265, U.S.A., together with all rights to file, and to claim priorities in connection with, corresponding patent applications in any and all foreign countries in the name of Deere & Company or otherwise.
